

Pragmatic evaluations of PDMP legislation to evaluate real world evidence

Jason Hoppe, DO

University of Colorado

Department of Emergency Medicine

SCHOOL OF MEDICINE

UNIVERSITY OF COLORADO **ANSCHUTZ MEDICAL CAMPUS**

Funding

- No conflicts of interest to report
- Funding: This project was supported by the **Bureau of Justice Assistance**. The Bureau of Justice Assistance is a component of the Department of Justice's Office of Justice Programs, which also includes the Bureau of Justice Statistics, the National Institute of Justice, the Office of Juvenile Justice and Delinquency Prevention, the Office for Victims of Crime, and the SMART Office. Points of view or opinions in this document are those of the author and do not necessarily represent the official position or policies of the U.S. Department of Justice.

Learning Objectives

- 1) Discuss the current **challenges to collecting data on provider PDMP use** within clinical encounters
- 2) Describe the **potential benefits of pragmatic trials** for PDMP interventions and legislation
- 3) Understand the need to ensure government agencies, public health and researchers have **access to timely and actionable data** about the impact of PDMP legislation and interventions on opioid prescribing

PDMP creation/implementation before ideal design

- High quality pharmacy data, but outside clinical workflows

- Legal/audit trail tracking of PDMP access, not clinical

- Limits evidence collection on mandates/policies:

 - high volume actions and lack data connections

- Need mechanisms to track “real world” PDMP use, impact on clinical decisions and patient outcomes**

 - (vs population level, observational and pre/post studies)

Challenges to traditional research methods

1) Clinical research is **slow and expensive!**

- Only 14% of research → change practice
- Take 17 years on avg to get into practice

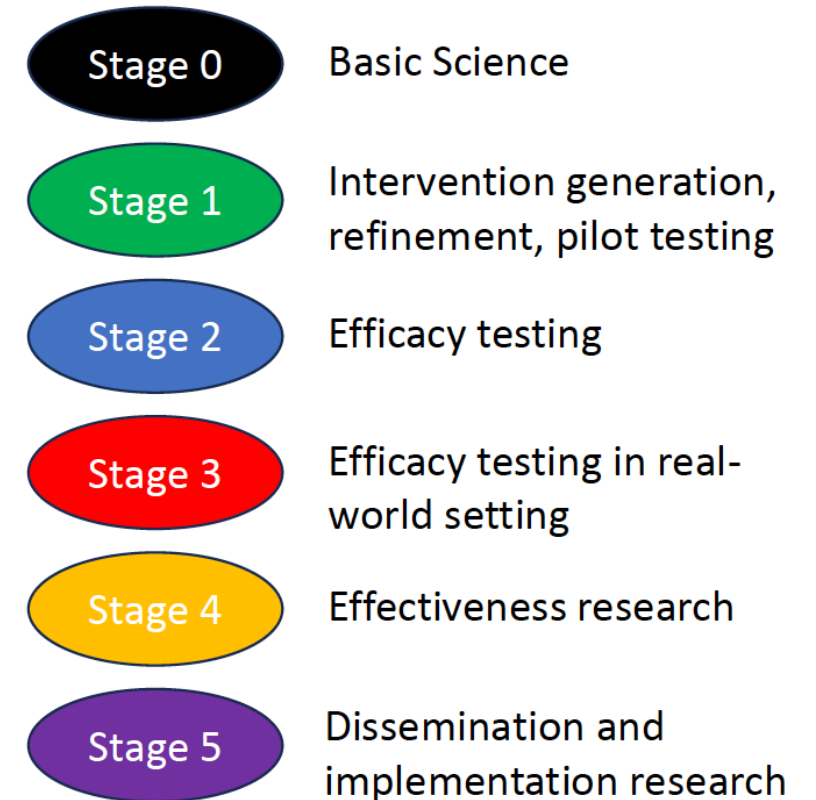

2) Results often **not relevant to practice**

- Effectiveness in selected populations and ideal conditions

3) Need mechanism to collect PDMP use and evidence in real clinical practice

- Leverage/connect existing data streams

NIH Stage Model

Why we need a new approach?

We aren't reaching or measuring the impact of PDMP use for those most in need

Current approaches aren't in clinical settings, findings not implementable for systems/providers

We aren't asking questions important to providers, administrators, and policymakers

Why pragmatic research?

- Practical answers to real world questions: practice and policy
- Questions of interest to decision makers (patients, physicians, or policy makers)
- Focus on addressing real-world effectiveness
- Maximizing the chance that the results will apply to patients that are seen in practice (external validity)
- ***Does an intervention work under usual conditions?***

	EXPLANATORY	PRAGMATIC
Research question	Efficacy: Can the intervention work under the best conditions	Effectiveness: Does the intervention work when used in normal practice?
Setting	Well-resourced “ideal” setting	Normal care settings including primary care, community clinics, hospitals
Population	Highly selected	More representative with less strict eligibility criteria
Intervention design	Tests against placebo, enforcing strict protocols & adherence	Tests 2 or more real-world treatments using flexible protocols
Outcomes	Often short-term surrogate or process measures; data collected outside routine care	Clinically important endpoints; data collected in routine care
Clinical relevance	Indirect: Not usually designed for making decisions in real-world settings	Direct: Purposely designed for making decisions in real-world settings

Limitations of pragmatic trials

- Routine care **data may be sparse**, few clinical variables
- Electronic health record data save's money, but it typically **inconsistent data collection and missing data (outcomes)**
- Relying on typical clinicians → increased variability in practice and associated documentation of clinical findings
- Variation → **reduce statistical precision** and the capability of answering the research question **unequivocally**

Electronic Health Record (EHR) data

- Clinical decision support (technical lift)
 - Identify *when* a controlled medication order started and finished
 - Measure *if* PDMP used within encounter
 - Intervention: *Facilitate* PDMP use (risk based, mandated, informed mandated)

The screenshot shows a software interface with a light blue header containing the text "Attention (1)" and an upward-pointing arrow icon. Below the header is a yellow banner with a warning icon and the text "Additional review required (BPA #14118)". The main content area has a yellow background and contains the heading "Please Review this Patient's PDMP". Below the heading is a paragraph: "It is considered best practice to review the PDMP prior to prescribing a controlled medication. [Learn more about this BPA](#)". Underneath this paragraph is a blue arrow pointing left and the text "Review PDMP and Click 'Mark as Reviewed' button to proceed." Below this is a red warning icon followed by the text "Acknowledge Reason" and a horizontal line. A blue button labeled "Comment" is positioned below the line. At the bottom right of the interface, a grey button with a green checkmark and the text "Accept" is circled in red. A blue arrow points from the right edge of the screen towards the "Learn more about this BPA" link, and a green arrow points from the right edge towards the "Review PDMP" text.

Attention (1)

⚠ Additional review required (BPA #14118)

Please Review this Patient's PDMP

It is considered best practice to review the PDMP prior to prescribing a controlled medication. [Learn more about this BPA](#)

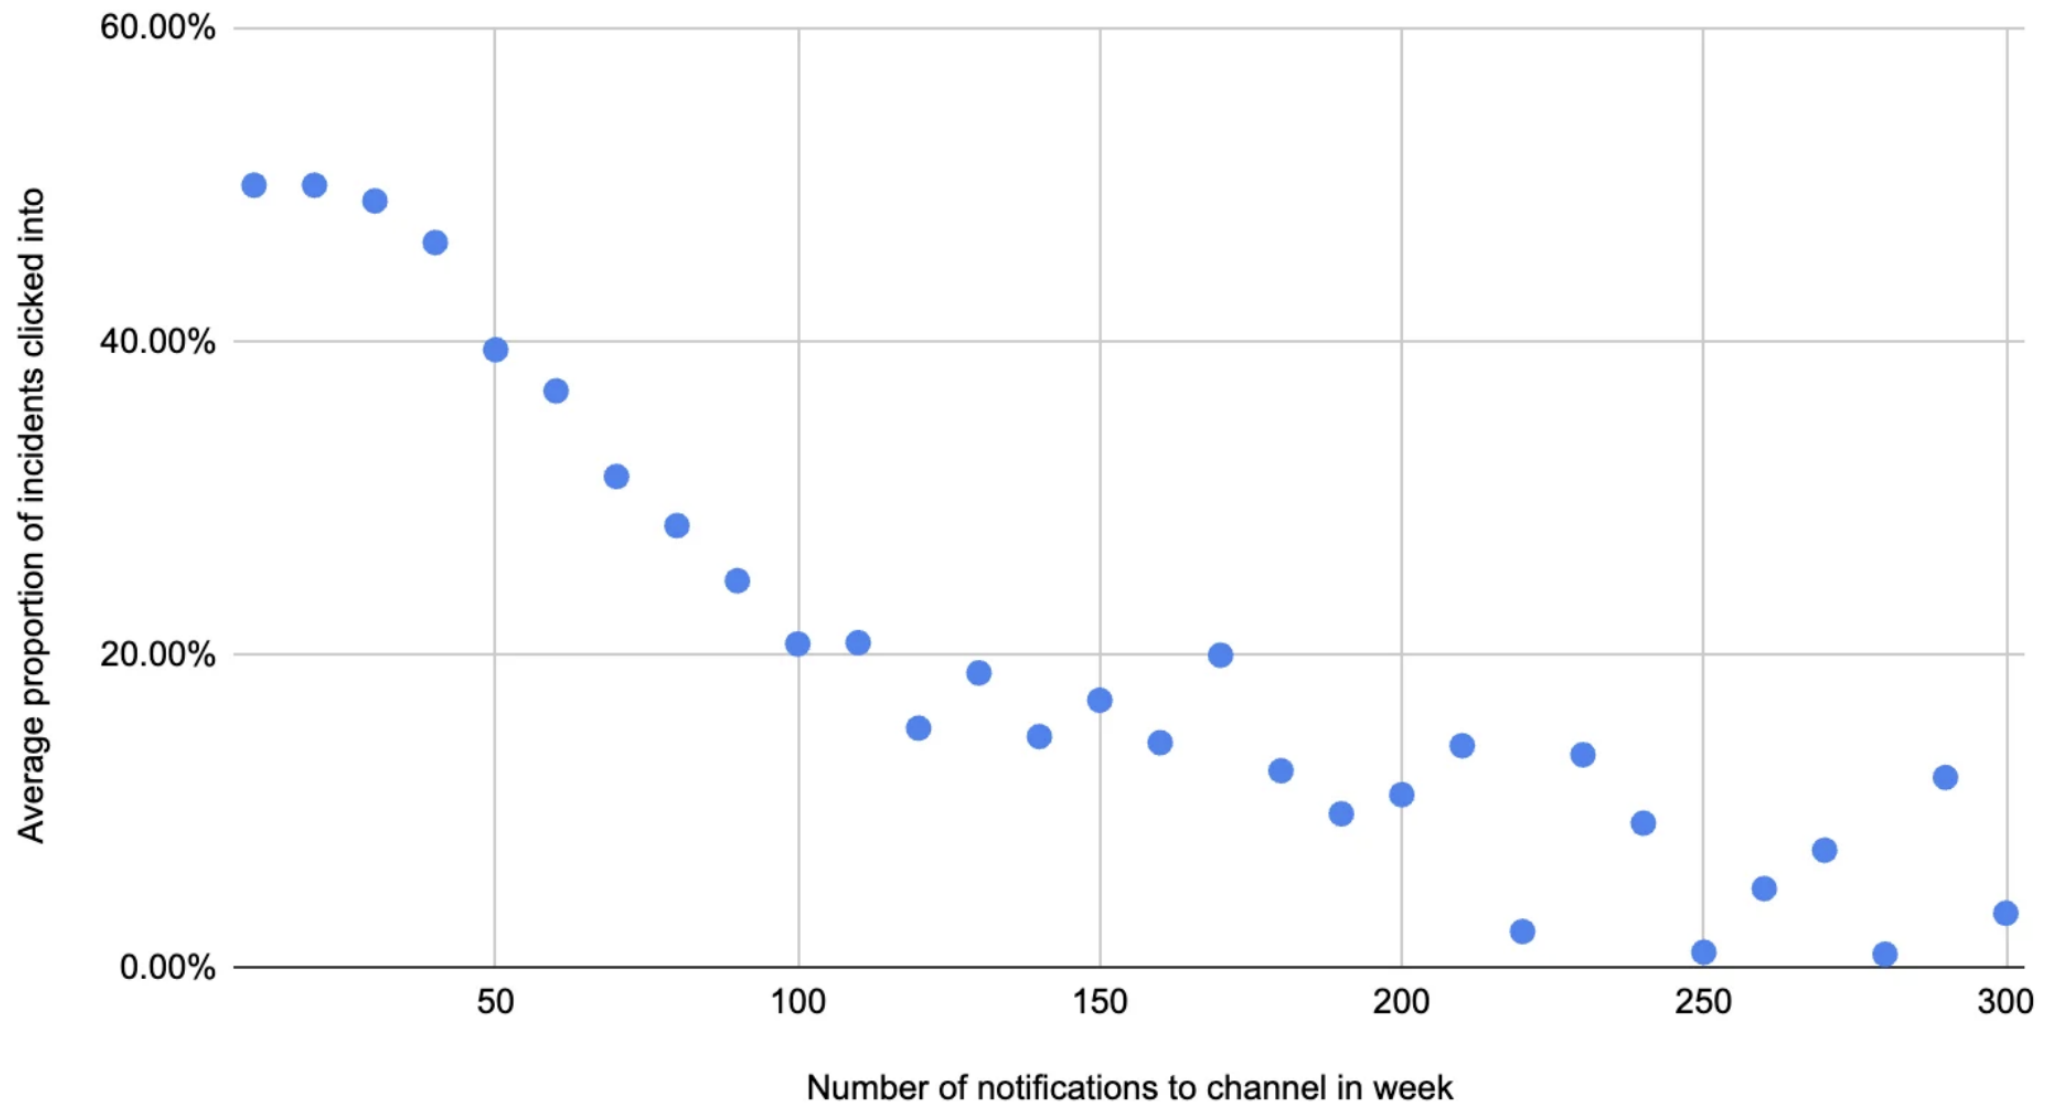

➡ Review PDMP and Click "Mark as Reviewed" button to proceed.

Data driven, pragmatic PDMP evaluation

1. Was a controlled medication prescription considered?

Data driven, pragmatic PDMP evaluation

1. Was a controlled medication prescription considered?

2. PDMP Y/N?

Data driven, pragmatic PDMP evaluation

1. Was a controlled medication prescription considered?

2. PDMP Y/N?

3. Was the prescription signed by the provider?

Data driven, pragmatic PDMP evaluation

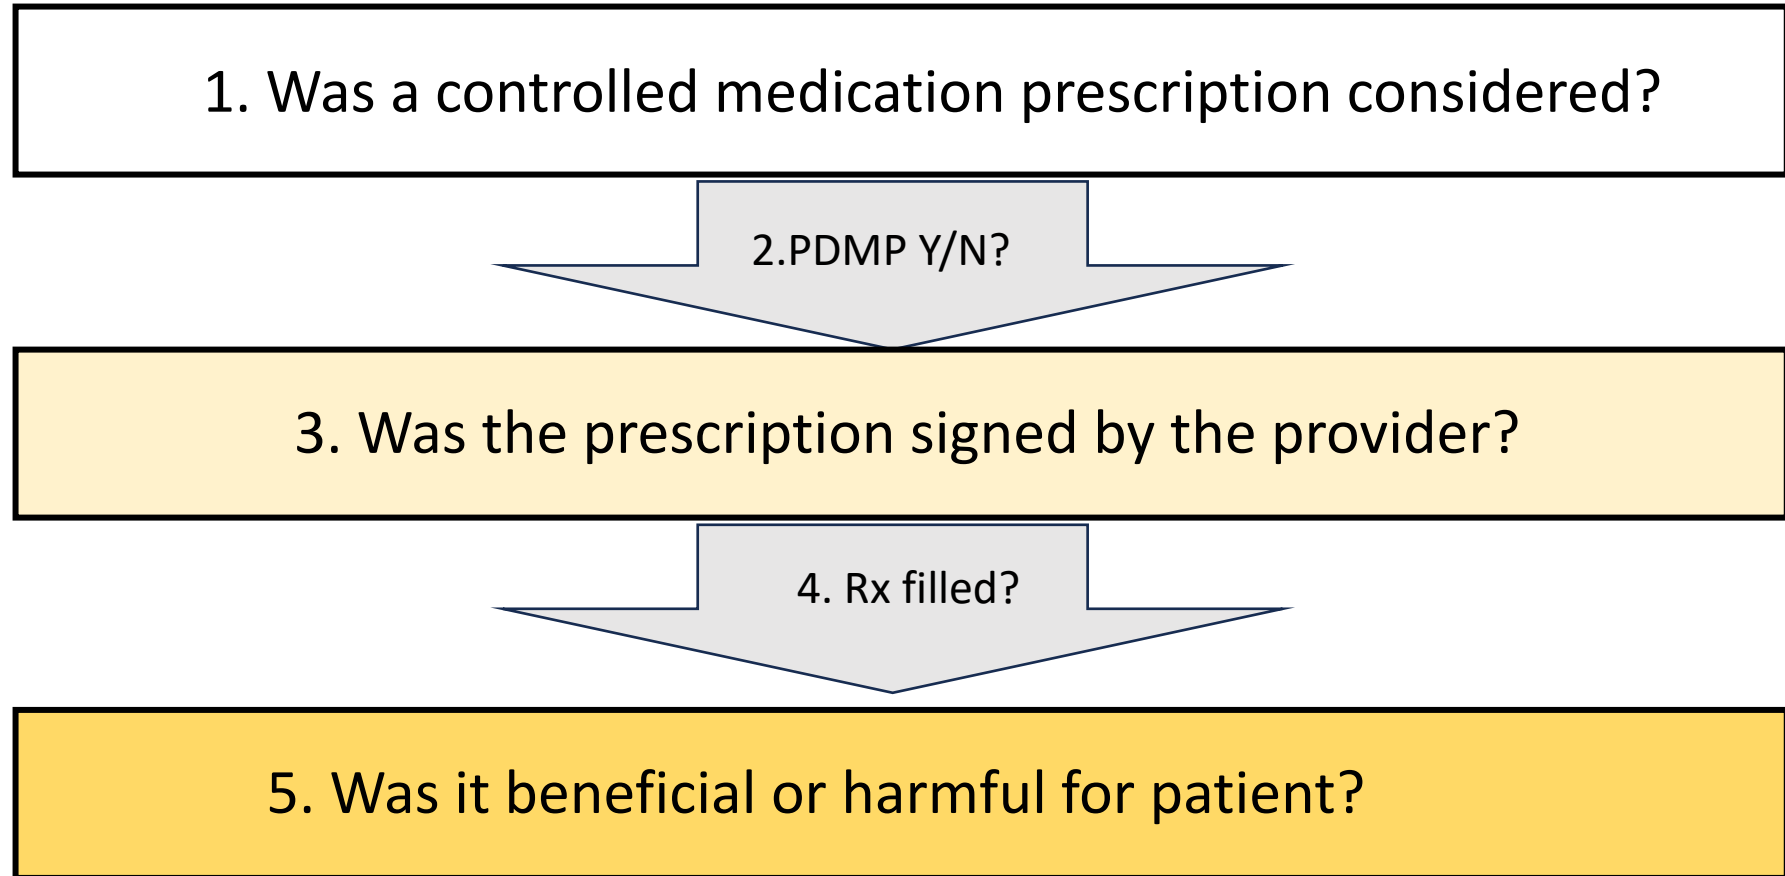

1. Was a controlled medication prescription considered?

3. Was the prescription signed by the provider?

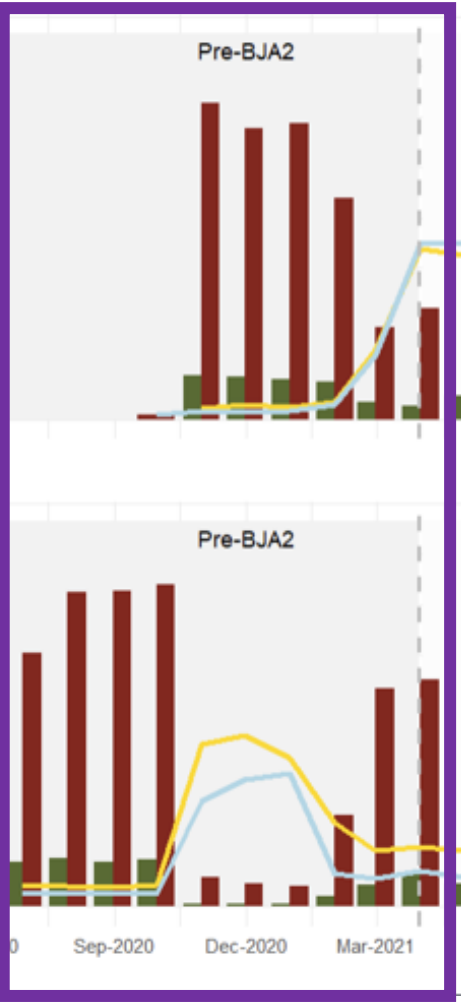

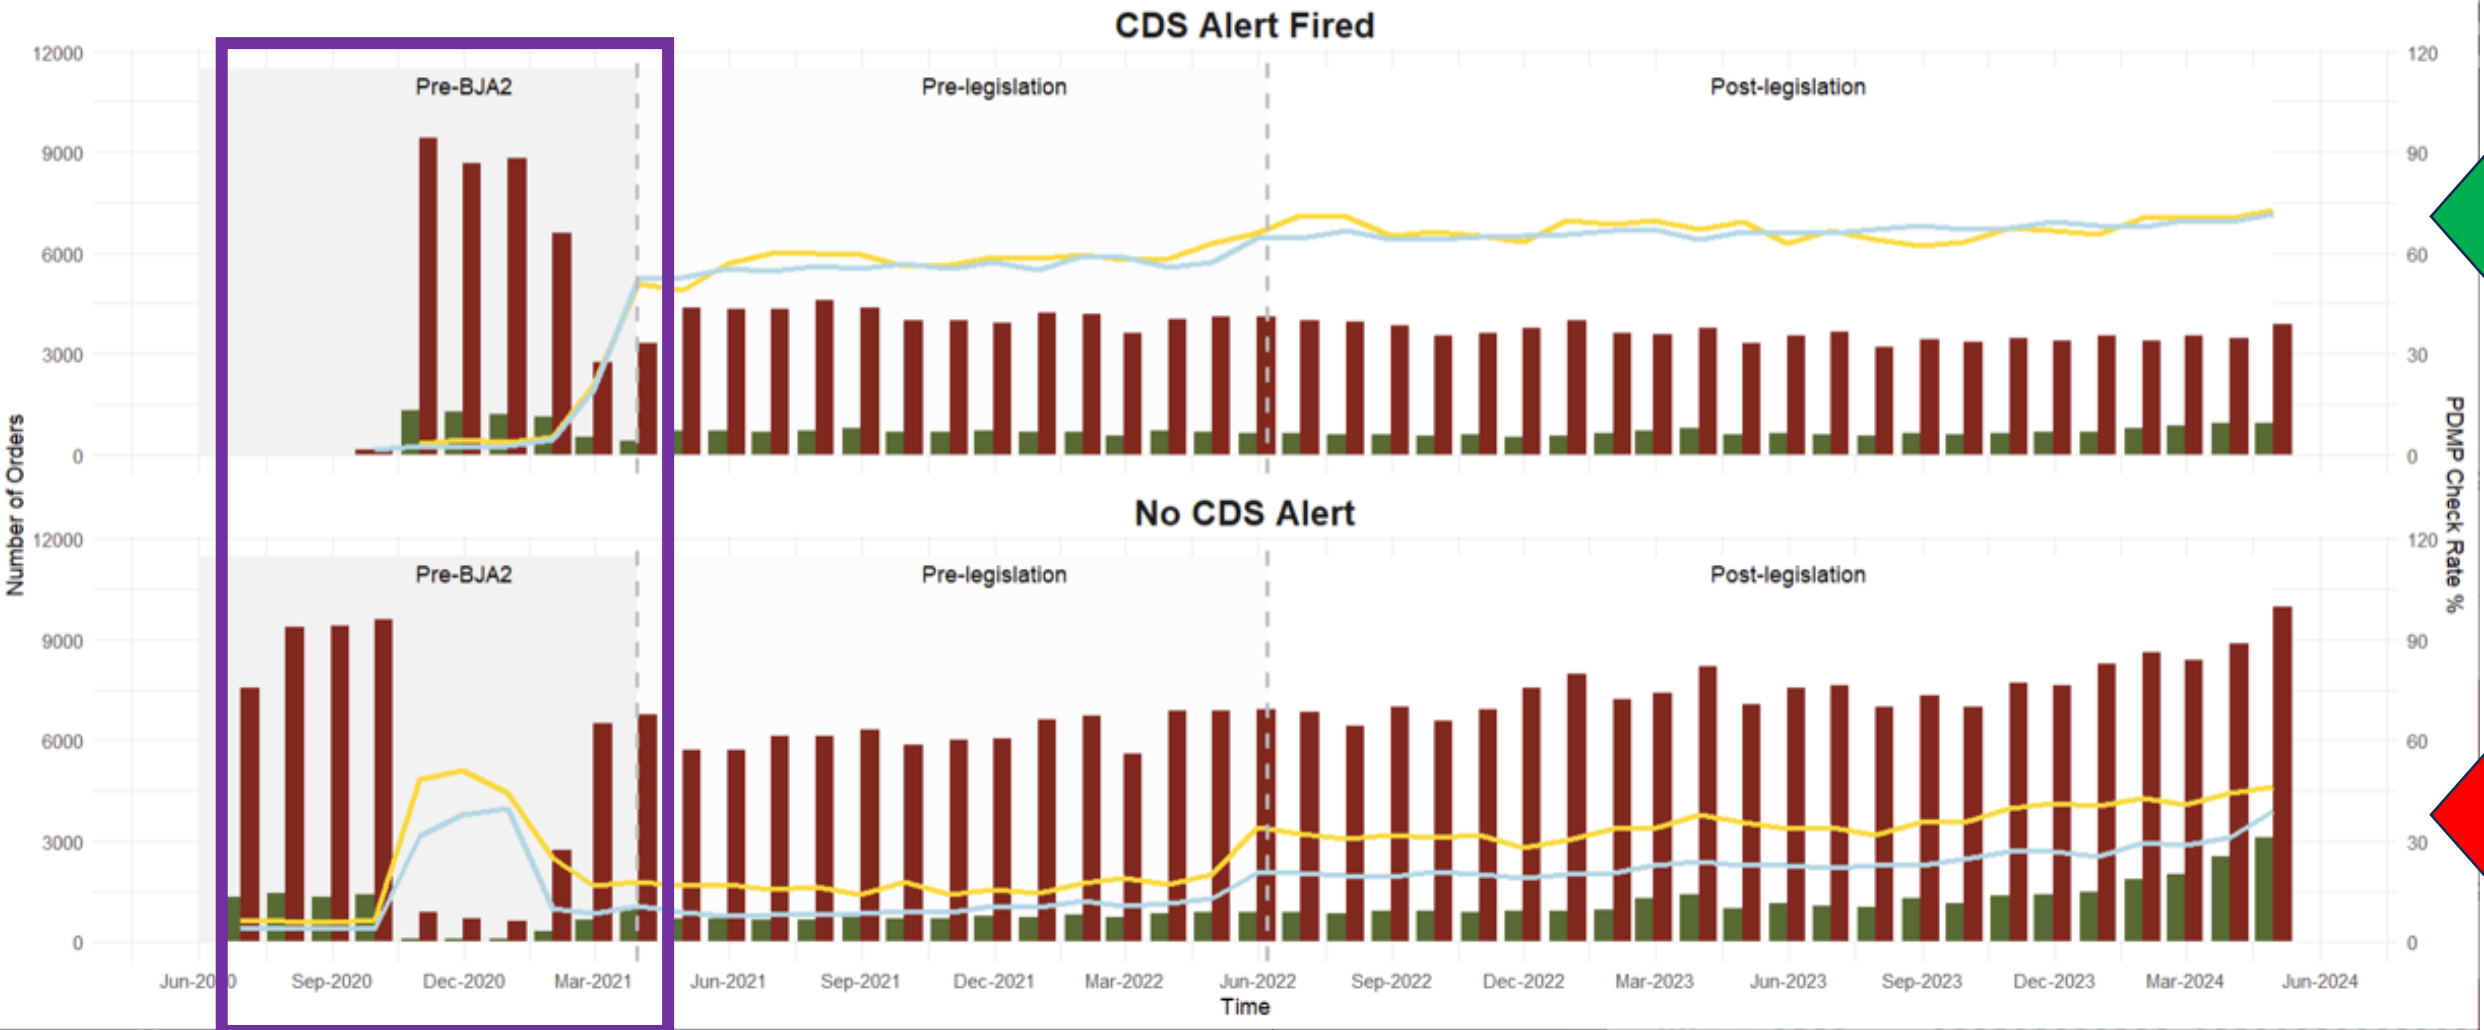

Data driven, pragmatic PDMP evaluation

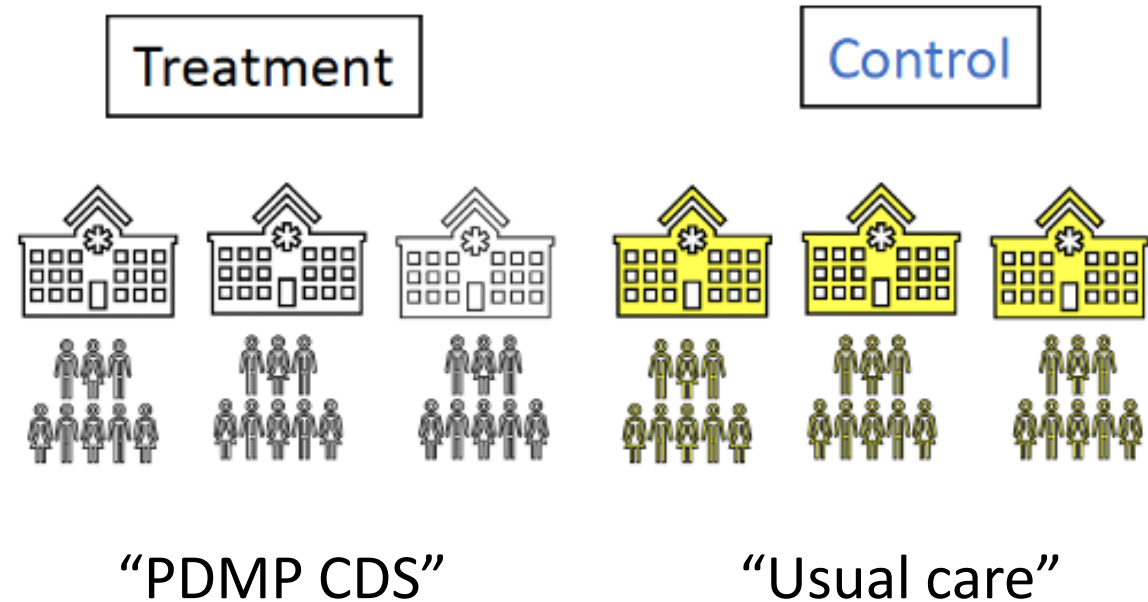

Medication Order Count vs PDMP Check Rate

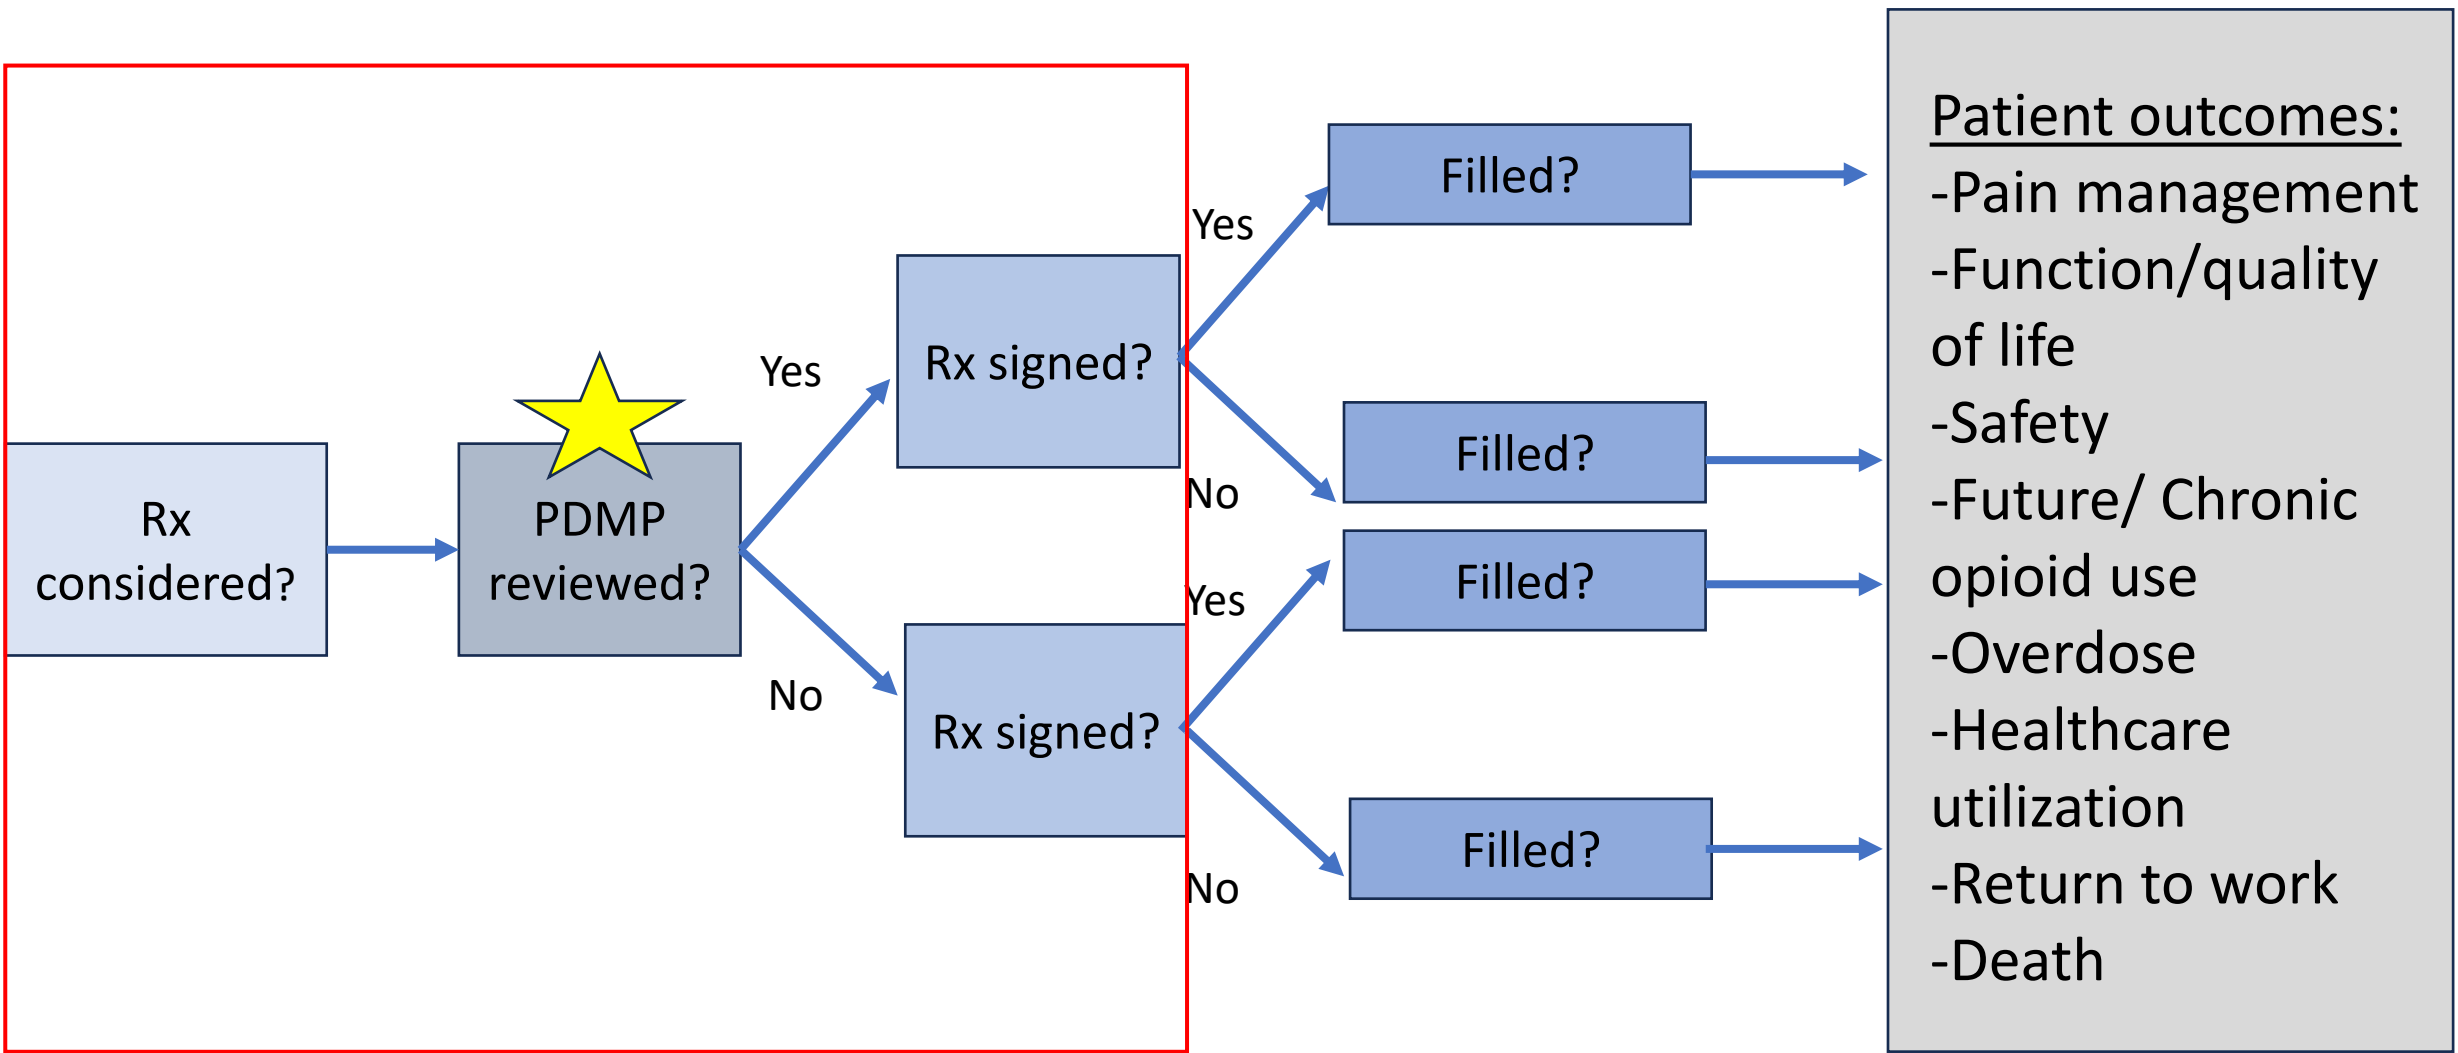

Medication ■ Benzodiazepine ■ Opioid

Cluster randomization

- Identify providers/settings
- Balance groups
- Assign an intervention
 - Level of assignment
- Validate data collection
- Compare risk in groups

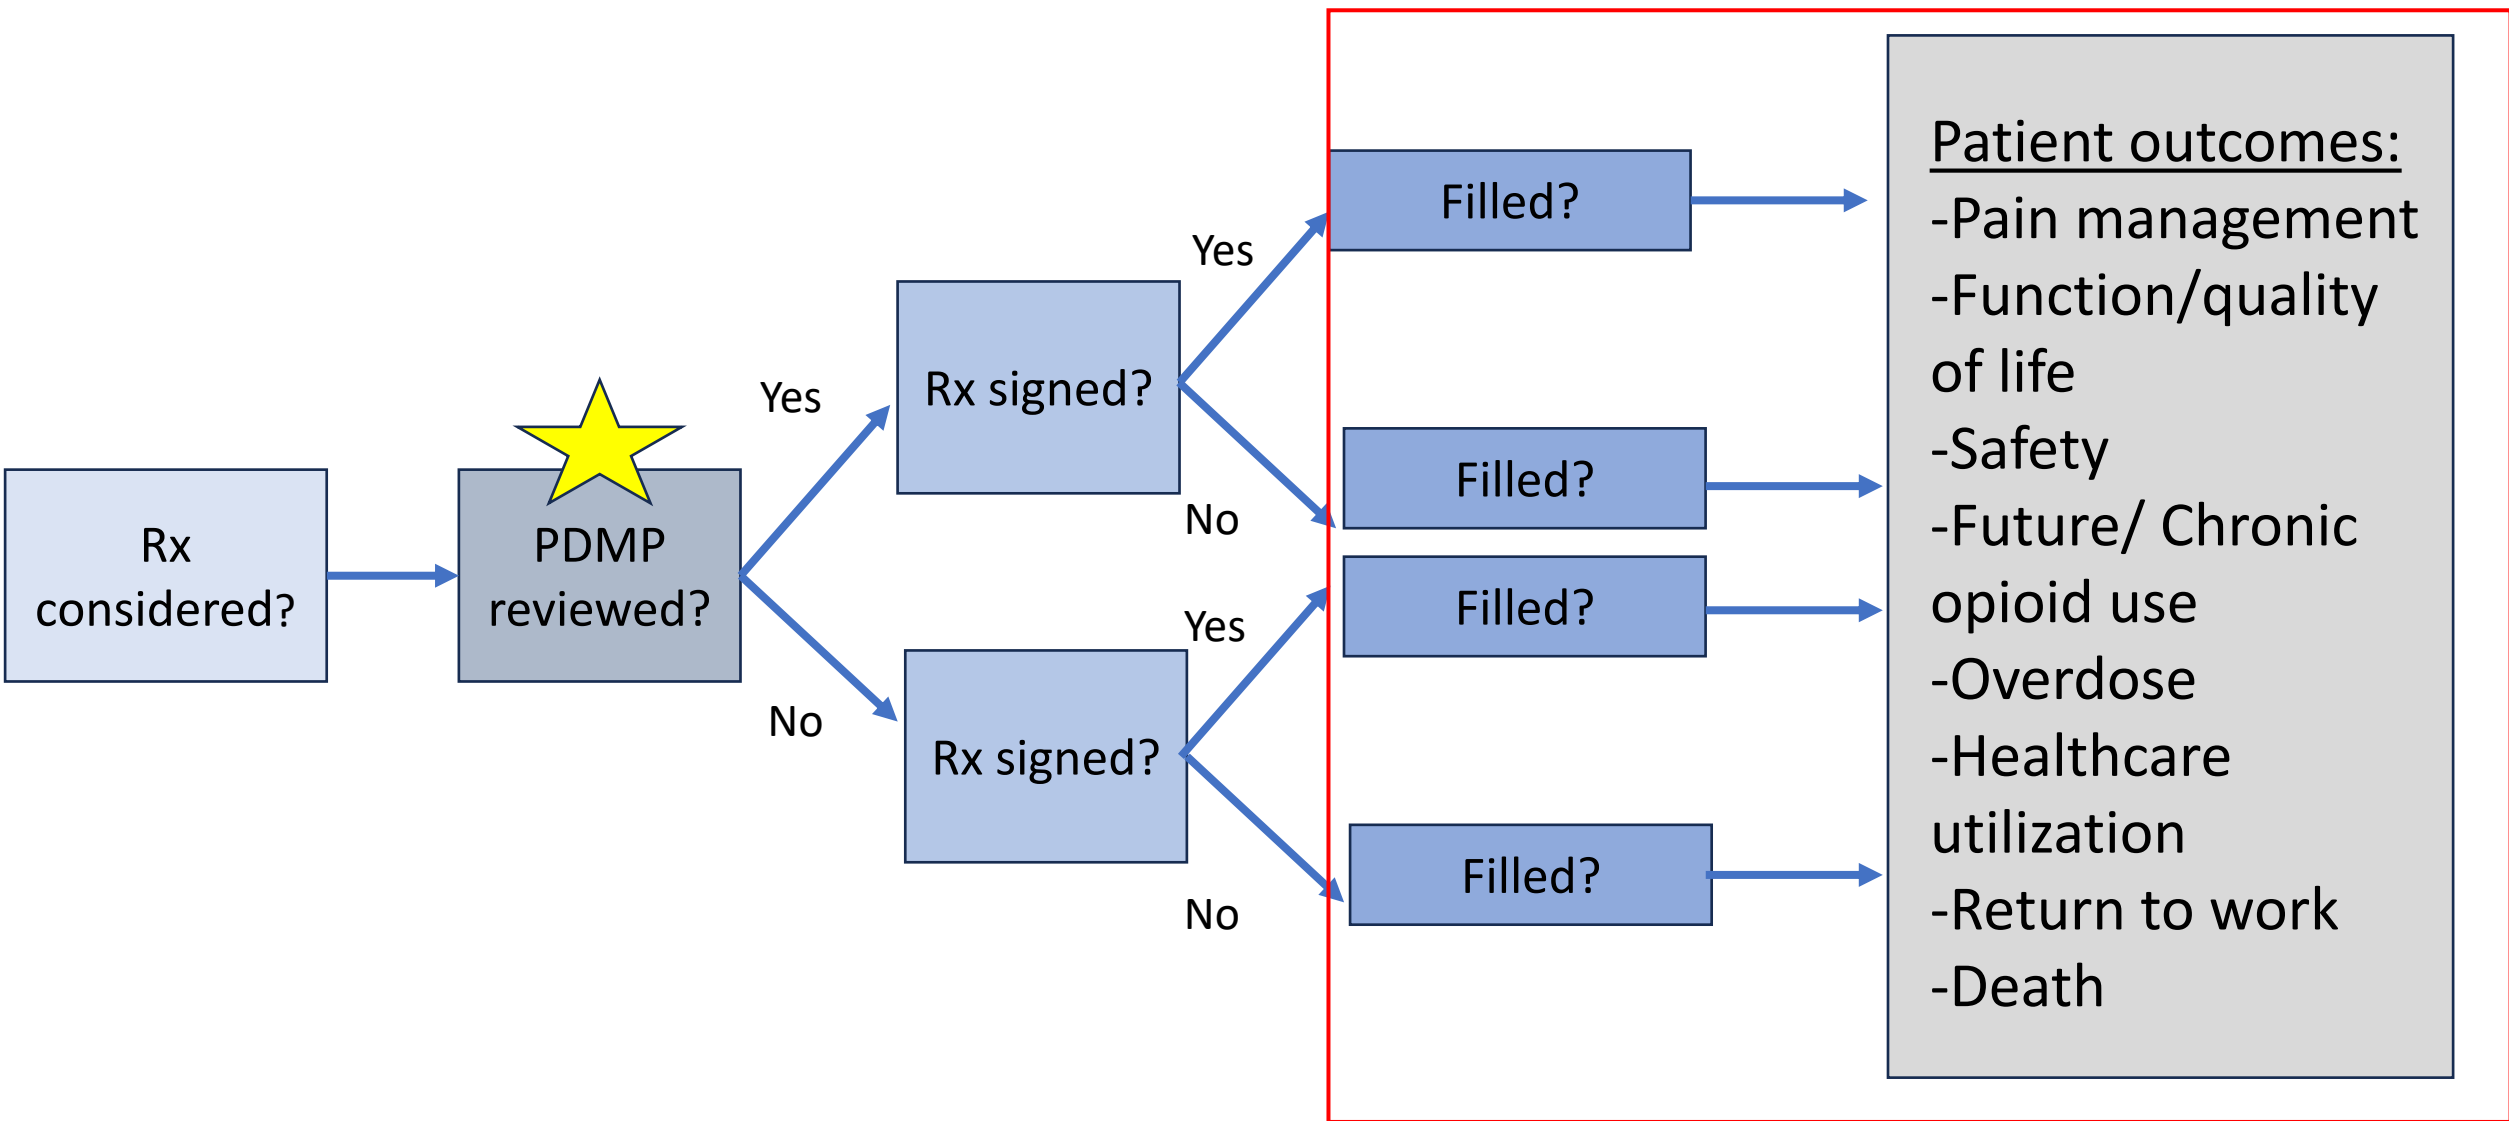

Patient outcomes:
-Pain management
-Function/quality of life
-Safety
-Future/ Chronic opioid use
-Overdose
-Healthcare utilization
-Return to work
-Death

CDS can facilitate PDMP review (vs Control 37%)

PDMP checked	Mandated CDS	PDMP risk	PDMP+EHR risk
Yes	95.1%	85.4%	87.7%
No	4.9%	14.6%	12.3%

PDMP review changes opioid prescribing decisions (high risk)

Opioid Abandonment Rate by Settings			
	PDMP Reviewed		P-value*
	Yes	Not Reviewed	
Outpatient			
Opioid rx completed after PDMP review?			<0.0001
No (abandoned)	5.4%	3.4%	
Yes (no change)	94.6%	96.6%	
Emergency Department			
Opioid rx completed after PDMP review?			<0.0001
No (abandoned)	7.9%	3.1%	
Yes (no change)	92.1%	96.9%	
In patient			
Opioid rx completed after PDMP review?			<0.0001
No (abandoned)	11.7%	4.2%	
Yes (no change)	88.3%	95.8%

Pragmatic trials: key take aways

Practical

- Designed to test what will work in everyday care, with emphasis on successful implementation.

Inclusive

- PCTs study diverse populations receiving care in real-world settings using broadly inclusive criteria for study participation.

Engaged

- Health systems, providers, and patients are involved in study design, collecting data, interpreting results, and acting on findings.

Relevant

- Results designed to directly inform decision-making of administrators, providers, patients, and policymakers.

Thank you!
